nucleic acid molecule encoding a platelet membrane glycoprotein receptor glycoprotein VI (GPVI), also called TANGO 268. The GPVI polymucleotides and bolypeptides and their modulators, e.g. antitisense nucleic acids, ribozymes and antibodies, are useful for preventing, treating and diagnosing disorders associated with aberrant expression or activity of GPVI. These disorders include bleeding disorders (e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders (e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders (e.g. thrombotic occlusion of the coronary arteries), haemorrhagic disorders, coronary artery and cerebral artery diseases (e.g. stroke and ischaemia), ammunological diseases (e.g. platelet disorders and myocardial infarction), immunological diseases (e.g. platelet disorders) and embryonic liver disorders. Preferzably they are used to prevent acture cardiac ischaemia following angioplasty and metastatic cancers, especially of the colon and

This invention relates to a novel purified antibody comprising a variable heavy (VH) complementarity determining region (CDR), VH CDR2 or VH CDR3, or variable light (VL) CDR1, VL CDR2, and immunospecifically binding to a TANGO 268 (Also referred as glycoprotein VI (GPVI)) untigen. The antibodies of the invention act to decrease or block TANGO 268 binding to extracellular matrix components, or as a Collagen or platelet release and aggregation blocker. The antibodies of the invention are useful for modulating proliferation, migration, morphology, differentiation and/or function of megakaryocytes and platelets,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel substantially purified antibody immunospecifically binding to TANGO 268 antigen, useful for treating bleeding disorders such as thrombocytopenia, stroke, ischemia, pulmonary embolism, atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               aberrant megakaryocyte and/or placelet proliferation, migration, morphology, differentiation and/or function, e.g. bleeding disorders suc as thrombocytopaenia. Other diseases which may be modulated by these antibodies are thrombocit disorders, cerebral vascular disease; (e.g. stroke and ischaemia) venous thromboembolism diseases (e.g. diseases troversed and ischaemia) venous thromboembolism diseases (e.g. diseases coronary diseases (e.g. cardiovascular diseases including angina pectoris, myocardial infarction, coronary restenosis, atherosclerosis, elic); immunological diseases, evelopmental diseases, embryonic disorders, liver disorders, cerebral vascular diseases, embryonic thromboembolism disease, coronary diseases, and metastatic cancers. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       including during development e.g. embryogenesis, modulating leukocyte-platelet and platelet-endothelium interactions in inflammation and/or thrombosts, and modulating platelet aggregation and degranulation. They are also useful for modulating disorders associated with abnormal or

The present sequence is given in a specification relating to an isolated nucleic acid molecule encoding a platelet membrane glycoprotein receptor glycoprotein via (GPVI), also called TANGO 268. The GPVI polymucleotides and polypeptides and their modulators, e.g. antisense nucleic acids, riboxymes and antibodies, are useful for preventing, treating and diagnosing disorders associated with aberrant expression or activity of GPVI. These disorders include bleeding disorders (e.g. thrombotic occlusion of the coronary arteries), haemorrhagic disorders (e.g. thrombotic occlusion of the coronary arteries), haemorrhagic disorders, coronary artery and cerebral artery diseases (e.g. stroke and ischaemia), cardiovascular diseases (e.g. atherosclerosis and myocardial infarction), immunological diseases (e.g. platelet disorder and embryonic liver (immunological diseases) they are used to prevent acture cardiac ischaemia disorders. Prefetrably they are used to prevent acture cardiac ischaemia following angioplasty and metastatic cancers, especially of the colon and
                                                                                                                                                                                 ö
antibodies of the invention only causes a transient decrease in platelet counts, platelet aggregation, and/or platelet activation and so have some advantages over prior art methods. The present sequence represents a peptide sequence used to generate the antibodies of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse, TANGO 268, cardiant, cerebroprotective, cytostatic, anticoagulant, thrombolytic, antiatteriosclerotic, haemostatic; glycoprotein VI; GPVI; platelet membrane glycoprotein receptor, bleeding disorder, blood vessel injury, thrombotic disorder, haemorrhagic disorder, stroke, ischaemia, cardiovascular disease, immunological disease, liver disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel purified antibody comprising a variable heavy (WH) complementarity determining region (CDR1, WH CDR2) or WH CDR3, or variable light (VL) CDR1, VL CDR3, and immunospecifically binding to a TANGO 268 (also referred as glycoprotein VI (GPVI)) antigen. The antibodies of the invention act to decrease or block TANGO 268 binding to extracellular matrix components, or as a Collagen or platelet release and aggregation blocker. The antibodies of the invention are useful for modulating proliferation, migration, morphology, differentiation and/or function of megakaryocytes and platelets,
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; mouse; variable heavy; VH; antigen; cancer; complementarity determining region; TANGO 268; glycoprotein VI; GPVI; TANGO 268; extracellular matrix; collagen; platelet release; proliferation; matration; embryogenesis; inflammation; thrombosis; degranulation; thrombocytopaenia; antibody; thrombotic disorder; cerebran vascular disease; stroke; ischeemia; venue thromboembolism; leg swelling; pain; ulceration; pulmonary embolism; coronary disease; cardiovascular disease; angina pectoris; myocardial infarction; coronary restenosis; atherosclerosis; immunological disorder; coronary disease; developmental disorder; embryonic disorder; liver disorder; cerebral vascular disease.

antibodies are thrombotic disorders, cerebral vascular diseases (e.g. stroke and ischaemia) venous thromboembolism diseases (e.g. diseases) involving leg swelling, pain and ulceration, pulmonary embolism, etc); coronary diseases (e.g. cardiovascular diseases including angina pectoris, myocardial infarction, coronary restenosis, atherosclerosis, etc); immunological disorders, developmental disorders, embryonic disorders, liver disorders, developmental disorders, venous thromboembolism disease, coronary diseases, and metastatic cancers. The antibodies of the invention only causes a transient decrease in platelet counts, platelet aggregation, and/or platelet activation and so have some advantages over prior art methods. The present sequence represents a peptide sequence used to generate the antibodies of the invention
                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Anti-thrombotic medicament, comprising a polypeptide having the extracellular domain of platelet membrane glycoprotein VI or its variant, useful for treating a vascular disease and reducing platelet activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a human platelet membrane glycoprotein VI (GPVI) peptide 11. The medicament comprising GPVI is useful for treating vascular disease, and for reducing platelet activation which involves contacting platelets with the medicament. The extracellular portion of GPVI is used therapeutically to attenuate platelet activation and Antibodies generated against GPVI are used as research and immunotherapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; platelet membrane glycoprotein VI; GPVI; thrombolytic; therapy; vascular disease; thrombosis.

The medicament comprising GPVI is useful for treating vascular disease, and for reducing platelet activation which involves contacting platelets with the medicament. The extracellular portion of GPVI is used therapeutically to attenuate platelet activation and aggregation and to treat thrombosis and other vascular diseases. Antibodies generated against GPVI are used as research and immunotherapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Anti-thrombotic medicament, comprising a polypeptide having the extracellular domain of platelet membrane glycoprotein VI or its variant, useful for treating a vascular disease and reducing platelet activation.
                                                                                                                                                                                                                      Human; platelet membrane glycoprotein VI; GPVI; thrombolytic; therapy; vascular disease; thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a method of detecting (M1) cancer in a patient that binds to any of three polypeptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binds of three polypeptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binding agent; and (iii) comparing the amount of polypeptide present in the patient, as sample to a predetermined cutoff value. The specification also discloses a separate method for detecting (M2) cancer in a patient by a method similar to M1, except that the detection agent is an oligonucleotide that binds to any of three polymucleotides given in the specification. M1 and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants in a patient special mailganacies. This sequence corresponds to a more types of hematological mailganacies. This sequence corresponds to a
                                                                                                                                                                                                                                                                                                 Detecting cancer in a patient comprises contacting a biological sample from the patient with a binding agent that binds to a cancer-associated polypeptide and comparing the amount of polypeptide to a predetermined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human LY1448P cancer related peptide for cancer detection method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti-thrombotic medicament, comprising a polypeptide having the extracellular domain of platelet membrane glycoprotein VI or its variant, useful for treating a vascular disease and reducing platelet activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a human platelet membrane glycoprotein VI (GPVI) peptide 12. The medicament comprising GPVI is useful for treating vascular disease, and for reducing platelet activation which involves contacting platelets with the medicament. The extracellular portion of GPVI is used therapeutically to attenuate platelet activation and angeregation and to treat thrombosis and other vascular diseases. Antibodies generated against GPVI are used as research and immunotherapeutic agents
                                                                                                          Human; platelet membrane glycoprotein VI; GPVI; thrombolytic; therapy;
vascular disease; thrombosis.

                                                                                                                                            The invention relates to a method of detecting (MI) cancer in a patient by: (by: (I) contacting a biological sample from the patient with an agent that binds to any of three polypeptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binding agent; and (iii) comparing the amount of polypeptide present in the patient's sample to a predetermined cutoff value. The specification also discloses a separate method for detecting (M2) cancer in a patient by a method similar to M1, except that the detection agent is an except that binds to any of three polymucleotides given in the specification. M1 and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants in a patient, especially chronic lymphocytic leukemia. The applicants types of hematological malignancies. This sequence corresponds to a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, secreted protein, fusion protein, gene therapy, protein therapy, diagnosis, tissue, cancer, tumour, neurodegenerative disorder, leukaemia, developmental abnormality; foetal deficiency, blood, allergy, renal; immune system, asthma, lymphocytic disease, brain, hepatic, lymphoma; inflammation; ischaemic shock; Alzheimer's disease, restenosis, AIDS; cognitive disorder; schizophrenia; prostate; obsety, osteoclast, thymus, osteoporosis, arthritis; testis; lung; thyroidtis; thyroid, digestion; endocrine; metabolism; regulation; malabsorption; gastritis; neoplasm.
                                                         Detecting cancer in a patient comprises contacting a biological sample from the patient with a binding agent that binds to a cancer-associated polypeptide and comparing the amount of polypeptide to a predetermined cutoff value.

```
This sequence represents a fragment of a secreted human protein encoded by the nucleic acid molecule detailed in the descriptor line. The gene can be used to generate fusion proteins by inking to the gene a human immunoglobulin Fc portion (e.g. AAX04302) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAX04311-X04410; amino acid sequences AAW78126-W78255) which are useful for preventing, treating or analorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 86 polynucleotides. based on which tissues they are most highly expressed in (see AAX04311 for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gabs

The invention provides an isolated nucleic acid encoding a polypeptide of the leucine rich repeat (LRR) family, designated 33395. The 33395 by polypeptide can be expressed by standard recombinant methodology. The 33395 polynucleotides and polypeptide can be used to prevent or treat disorders associated with 33395 expression, for example those involving aberrant callular adhesion, proliferation or differentiation. Specific examples include meloblastoma, juvenile AIDS, diabetes mellitus, reamples include meloblastoma, juvenile AIDS, diabetes mellitus, cheumatoid arthritis, systemic lupus erythematosis, multiple sclerosis, chron's disease, ulcerative colitis, asthma, anemia, and chronic active hepatitis. Sequences AAG65815-817 represent consensus amino acid
antiarthritic; neuroprotective; dermatological; immunosuppresive; antiinflammatory; antiasthmatic; antiulcer; antianaemic; hepatotropic.
                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide for preventing or treating disorders associated with cellular adhesion, proliferation or differentiation, comprises polypeptide 33395, a member of the leucine rich repeat protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            derived from a hidden Markov model corresponding to the

The invention relates to human sodium channel beta-4 subunit, 98359

polypeptides and polynucleotides. The methods and compositions of the invention are useful for diagnosing, screening and treating disorders associated with aberrant or deficient sodium channel beta-4 subunit function or expression such as paramyotonia congenital, hyperkalaemic function or expression such as paramyotonia congenital, hyperkalaemic of pariodic paralysis, epilepsy, psychiatric disosaese (anxiety or phobic disorders, attention deficit disorder, obsessive-compulsive disorder and bipolar affective disorders, dementia, cardiovascular disorders and chipolar affective disorders (Alzheimer's or Parkinson's disorders (Chipotremsion, shock, heart failure, arrhythmias and cardiomyopathy), neurological disorders (Alzheimer's syndrome), autoimmune disorders spinocerebellar ataxia and Tourette's syndrome), autoimmune disorders (diabetes, arthritis), cellular proliferative disorders (cancer), bone metabolism disorders, viral infections (AIDS, rabies, herpes simplex, poliomyelitis, viral infections (AIDS, rabies, calerosis), pain and/or metabolic disorders (Leukodystrophies, Krabbe's disease and Leigh disease). Polynucleotides of the invention are used to identify an individual from a biological sample. The invention is useful in gene therapy. The present sequence is human protein related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated human sodium channel beta-4 subunit nucleic acid molecule and polypeptide, useful for diagnosing and treating disorders with aberrant beta-4 subunit function or expression, such as neurological and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; secreted protein, cancer, tumour, developmental abnormality, foetal deficiency; blood disorder; immune system disorder; inflammation; autoimmune disease, allergy; Alzheimer's disease, cognitive disorder; schizophrenia; arthritis; asthma; psoriasis; sepsis; skin disorder; atherosclerosis; diabetes; cardiovascular disorder; kidney disorder; digestive disorder; endocrine disorder; infection; AIDS; leukaemia;

 AAZ65250 to AAZ65350 represent 97 isolated human secreted protein genes.

AAY76124 to AAY7623 are the secreted proteins encoded by the 97 human genes. This sequence represents a fragment of one of the human secreted proteins. This sequence represents a fragment of the human secreted proteins. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 97 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, authorities, asthma, psoriasis, sepsis, skin disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, also useful for identifying their binding partners. The polypeptides are also useful for identifying their binding partners. The sequences shown in AAY76224 to AAY76424 represent fragments of the secreted proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä

The sequences are useful for preparing medicaments for preventing, treating or ameliorating medical conditions e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. This sequence represents a human secreted polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule, useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g. cancer, liver disorders or neural disorders.
                                                                                                                                                                                                                                  Rosen CA, Carter KC, Moore PA;

This invention relates to a novel composition comprising an isolated bloadtive keratin peptide of 4-39 amino acids in length. Specifically, it refers to keratin proteins that can stimulate the growth of dermal fibroblasts for use in treating damaged, aged or diseased epithelial tissue and skin. Furthermore, they exhibit cycokine-like activity, combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          these peptides as antinflammatory, antiulcer, vulnerary, analyses cand cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. decodourant, cleanser and toenail care compositions, also in topical applications to damaged epithelial tissue from sunburn, ulcers or puncture wounds so as to relieve pain, burning or skin grafts or diabetic ulcers. This peptide sequence, derived from human hair or sheep wool keratin proteins, is a biologically active keratin human hair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.
                                                                                                                                                     keratin; dermal fibroblast; epithelial tissue; cytokine-like activity; antighammatory; antiulcer; vulnerary; analgesic; cell proliferation activator; deodourant; cleanser; toemail care; sunburn; puncture wound; Crohn's disease; skin graft; diabetic ulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 43; DB 7; Length 34;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of detecting (MI) cancer in a patient by: (i) contacting a biological sample from the patient with an agent that binds to any of three polypoptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binding agent; and (iii) comparing the amount of polypoptide present in the capent; and (iii) comparing the amount of polypoptide present in the agent; and (iii) comparing the amount of polypoptide present in the agents as separate method for detecting (M2) cancer in a patient by a method similar to MI, except that the detection agent is an except conjuguous cotice that binds to any of three polymoclecides given in the specification. MI and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants in a patient especially chronic lymphocytic leukemia. The applicants they are useful for detecting the presence of cancer types of hematological malignancies. This sequence corresponds to a pertide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This invention relates to a noval composition comprising an isolated bloactive keratin peptide of 4-39 amino acids in length. Specifically, it refers to keratin proceins that can stimulate the growth of darmal fibroblasts for use in treating damaged, aged or diseased epithelial tissue and skin. Furthermore, they exhibit cytokine-like activity, particularly cell differentiation, adhesion and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes these peptides as antiinflammatory, antiulcer, vulnerary, analgesic and cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. decodurant, cleanser and toenail care compositions, also in topical applications to damaged epithelial tissue from sumburn, ulcers or puncture wounds so as to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human or it is shown or shown that it is a biologically active keratin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1;
                                                                                                                                                                                                                                                                                                                                                                                                                      Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        keratin; dermal fibroblast; epithelial tissue; cytokine-like activity; antiinflammatory; antiulcer; vulnerary; analgesic; cell proliferation activator; dedocurant; cleanser; toenail care; sunburn; puncture wound; Crobn's disease; skin graft; diabetic ulcer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             these peptides as antiinflammacry, antiulcer, vulnerary, analysic and cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. deedourant, cleanser and toenal care compositions, also in topical applications to damaged spithelial care from sunburn, ulcers or puncture wounds so as to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human paptide of the invention.
                                                                                                                                                                                                                                                      Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.
                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel composition comprising an isolated bloactive keratin peptide of 4.39 amino acids in length. Specifically, it refers to keratin proteins that can stimulate the growth of dermal fibroblasts for use in treating damaged, aged or diseased opithelial tissue and skin. Furthermore, they exhibit cytokino-like activity, particularly cell differentiation, adhesion and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes

This invention relates to a novel composition comprising an isolated bioactive keratin peptide of 4-39 amino acids in length. Specifically, it refers to keratin proteins that can stimulate the growth of dermal fibroblasts for use in treating damaged, aged or diseased epithelial tissue and skin. Furthermore, they exhibit cytokine-like activity, particularly cell differentiation, adhesion and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes these peptides as antiinflammatcry, antiulcer, vulnerary, analgesic and cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. decodourant, cleanser and toenail care compositions, also in topical applications to damaged epithelial tissue from sunburn, ulcers or puncture wounds so as to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human considered and provided sequence, derived from human considered and provided sequences derived from human considered and provided sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1;
                                                                                                                             Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   keratin, dermal fibroblast, epithelial tissue, cytokine-like activity, antifilammatory; antiulcer; vulnerary; analgesic; antiinflammatory; antivator; deanser; toenail care; sunburn; puncture wound, Crohn's disease; kin graft; diabetic ulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This invention relates to a novel composition comprising an isolated bioactive keratin peptide of 4-39 amino acids in langth. Specifically, it refers to keratin proteins that can stimulate the growth of dermal fibroblasts for use in treating damaged, aged or diseased epithelial tissue and skin. Furthermore, they exhibit cytokine-like activity, or articularly cell differentiation, adheason and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes these peptides as antiinflammatory antiulcer, vulnerary, analgesic and cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. dedocurant, cleanser and toenal care compositions also in topical applications to damaged epithelial tissue it om sumburn, ulcers or puncture wounds so as to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human hair or sheep wool keratin proteins, is a biologically active keratin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.

bioactive keratin peptide of 4-39 amino acids in length. Specifically, it refers to keratin proteins that can stimulate the growth of dermal tibroblasts for use in treating damaged, aged or diseased epithelial tissue and skin. Furthermore, they exhibit cytckine-like activity, particularly cell differentiation, adhesion and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes these peptides as antiinflammatory, antiulcer, vulnerary, analgesic and cell proliferation activators. Accordingly, there are various opplications for cosmetics e.g. deedourant, cleanser and toemail care compositions, also in topical applications to damaged epithelial tissue from sunburn, ulcers or puncture wounds so as to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human contents or sheet in proteins, is a biologically active keratin
                                                                                                                                                                                                                                                                                                                                                                                                                                                             1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel composition comprising an isolated bioactive keratin peptide of 4-39 amino acids in length. Specifically, it refers to keratin proteins that can stimulate the growth of dermal fibroblasts for use in treating damaged, aged or diseased epithelial tissue and skin. Furthermore, they exhibit cytokine-like activity, particularly cell differentiation, adhesion and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      keratin; dermal fibroblast; epithelial tissue; cytokine-like activity; antiloflammatory; antiloflesic; cell proliferation activator; dedocurant; cleanser; toenail care; sunburn; puncture wound; Crohn's disease; skin graft; diabetic ulcer.

This invention relates to a novel composition comprising an isolated bioactive keratin peptide of 4-39 amino acids in length. Specifically, it bioactive keratin proteins that can stimulate the growth of demal tistoplasts for use in treating damaged, aged or diseased apithelial tissue and skin. Furthermore, they exhibit cytokine-like activity, barticularly cell differentiation, adheeston and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes cell proliferation activators, antiulcer, vilnerary, analgesic and cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. decodourant, cleanser and toenail care compositions, also in topical applications to damaged epithelial tissue from sunburn, ulcers or puncture wounds so as to relieve pain, burning or techno. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human
                                                                                                                                                                                                                                                                                                         7
these peptides as antiinflammatory, antiulcer, vulnerary, analgesic and cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. decodourant, cleanest and toenail care compositions, also in topical applications to damaged epithelial tissue from sunburn, ulcers or puncture wounds so as to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from Luman hair or sheep wool keratin proteins, is a biologically active keratin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             keratin; dermal fibroblast; epithelial tissue; cytokine-like activity; antinflammatory; antiutucer; vulnerary; analgesic; cell proliferation activator; decourant; cleanser; toenail care; sunburn; puncture wound; Crohn's disease; skin graft; diabetic ulcer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel composition comprising an isolated bioactive keratin peptide of 4-39 amino acids in length. Specifically, it refers to keratin proteins that can simulate the growth of dermal fibroblasts for use in treating damaged, aged or diseased epithelial tissue and skin. Furthermore, they exhibit cytokine-like activity, particularly cell differentiation, adhesion and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes these peptides as antiinflammatory, antiulcer, vulnerary, analgesic and activity of damaged skin or bone tissue. The present invention describes these peptides as antiinflammatory, antiulcer, vulnerary, analgesic and applications for cosmetices. Accordingly, there are various applications also in topical applications to damaged epithelial tissue from sunburn, ulcers or puncture wounds so as to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human or sheet, or sheet in proteins, is a biologically active keratin

This invention relates to a novel composition comprising an isolated bloactive keratin peptide of 4-39 amino acids in langth. Specifically, it refers to keratin proteins that can stimulate the growth of dermal fibrablasts for use in treating damaged, aged or diseased epithalial tissue and skin. Furthermore, they exhibit cytokine-like activity, particularly cell differentiation, adhesion and migration, and in combination with other growth factors can be used to enhance the healing activity of damaged skin or bone tissue. The present invention describes these peptides as antiluflammatory, antilulear, vulnerary, analgesic and cell proliferation activators. Accordingly, there are various applications for cosmetics e.g. deodourant, cleanser and toenail care compositions, also in topical applications to relieve pain, burning or itching. The compositions can further be used to treat Crohn's disease, skin grafts or diabetic ulcers. This peptide sequence, derived from human hair or sheep wool keratin proteins, is a biologically active keratin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition comprising an isolated bioactive keratin peptides useful for cosmetic preparation, and treating conditions involving damaged, aged and diseased epithelial tissue and skin.
                                                                                                                                                                             keratin; dermal fibroblast; epithelial tissue; cytokine-like activity;

| Sequence 16, Application US/09865621A
| Patent No. 6555348
| Patent No. 6555348
| APPLICANT: ORGENSEN, FLEMMING
| APPLICANT: JORGENSEN, OLE CAI
| APPLICANT: STOUGAARD, PETER
| TITLE OF INVENTION: A NEW ENZYME ISOLATED FROM A BIFIDOBACTERIUM
| FILE REFERENCE: 02405.020
| CURRENT APPLICATION NUMBER: US/09/865,621A
| CURRENT FILING DATE: 2001-05-29
| PRIOR APPLICATION NUMBER: 60/207,154

Patent No. 6723830;
General No. 6723830;
General INPORMATION:
APPLICANT: Ben-Sasson, Shmuel A.
TITLE OF INVENTION: Short Peptides Which Selectively
TITLE OF INVENTION: Modulate the Activity of Protein Kinases;
TITLE OF INVENTION: Modulate the Activity of Protein Kinases;
FILE REFRENCE: 1242.1029-000 (CMCC-679)
CURRENT APPLICATION NUMBER: US/10/038,612
CURRENT FILING DATE: 1098-09-18
PRIOR FILING DATE: 1098-09-25
NUMBER OF SEQ ID NOS: 172
SOFTWARE: PSELSEQ for Windows Version 4.0
SEQ ID NO 53
LENGTH: 25
                                                                                                                                                               ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 35;

Patent No. 6745591
GENERAL INFORMATION:
APPLICANT: Hu, Yao Xiong
TITLE OF INVENTION: Immunological Methodology for Discerning Human Papillomavirus
FILE REFERENCE: 146-1-002
CURRENT APPLICATION NUMBER: US/09/828,645
PRIOR APPLICATION NUMBER: US 60/194,796
PRIOR PILING DATE: 2000-04-05
NUMBER OF SEQ ID NOS: 8
SOFTWARE: Patentin version 3.1
LENGTH: 30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
